128K x 32, 256K x 32 3.3V CMOS STATIC RAM MODULES

PRELIMINARY
IDT7MPV4060
IDT7MPV4145

FEATURES:

- High density 4 megabit and 8 megabit static RAM modules
- Low profile 72-lead, gold plated SIMM (Single In-line Memory Modules)
- Fast access time: 12ns (max.)
- Surface mounted plastic components on an epoxy laminate (FR-4) substrate
- Single 3.3V ($\pm 10\%$) power supply
- Multiple GND pins and decoupling capacitors for maximum noise immunity
- Inputs/outputs directly TTL compatible

NOTE:

DESCRIPTION:

The IDT7MPV4060 is a 128K x 32 static RAM module constructed on an epoxy laminate (FR-4) substrate using four 128K x 8 static RAMs in plastic SOJ packages.

The IDT7MPV4145 is a 256K x 32 static RAM module constructed on an epoxy laminate (FR-4) substrate using 8 256K x 4 static RAMs in plastic SOJ packages.

The IDT7MPV4060/7MPV4145 are available with access times as fast as 12ns with minimal power consumption.

The IDT7MPV4060/7MPV4145 are packaged in a 72-lead SIMM. The SIMM configuration allows use of edge mounted sockets to secure the module and with variable angled sockets, ideal for low profile requirements.

All inputs and outputs of the IDT7MPV4060/7MPV4145 are TTL compatible and operate from a single 3.3V supply. Full asynchronous circuitry requires no clocks or refresh for operation and provides equal access and cycle times for ease of use.

The contact pins are plated with 100 micro-inches of nickel covered by 30 micro-inches minimum of selective gold.

NOTES:

4054 tbl 07

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. V_{TERM} must not exceed V_{CC}+0.5V.

TIMING WAVEFORM OF READ CYCLE NO. 1⁽¹⁾

4054 drw 05

TIMING WAVEFORM OF READ CYCLE NO. 2^(1, 2, 4)

4054 drw 06

NOTES:

1. $\overline{WE}$ is HIGH for Read Cycle.
2. Device is continuously selected, $\overline{CS}$ is LOW.
3. Address must be valid prior to or coincident with the later of $\overline{CS}$ transition LOW; otherwise t_{AA} is the limiting parameter.
4. $\overline{OE}$ is LOW.
5. Transition is measured $\pm 200\text{mV}$ from steady state.

TIMING WAVEFORM OF WRITE CYCLE NO. 1 ($\overline{WE}$ CONTROLLED TIMING)^(1, 2, 5)

TIMING WAVEFORM OF WRITE CYCLE NO. 2 ($\overline{CS}$ CONTROLLED TIMING)^(1, 2, 5)

NOTES:

- $\overline{WE}$ must be HIGH, $\overline{CS}$ must be HIGH during all address transitions.
- A write occurs during the overlap of a LOW $\overline{CS}$ and a LOW $\overline{WE}$.
- $\overline{OE}$ is continuously HIGH. During a $\overline{WE}$ controlled write cycle with $\overline{OE}$ LOW, t_{WP} must be greater than or equal to $t_{WHZ} + t_{DW}$ to allow the I/O drivers to turn off and data to be placed on the bus for the required t_{DW} . If $\overline{OE}$ is HIGH during a $\overline{WE}$ controlled write cycle, this requirement does not apply and the minimum write pulse is the specified t_{WP} .
- During this period, I/O pins are in the output state, and input signals must not be applied.
- If the $\overline{CS}$ LOW transition occurs simultaneously with or after the $\overline{WE}$ LOW transition, the outputs remain in a high impedance state. $\overline{CS}$ must be active during the t_{CW} write period.
- Transition is measured $\pm 200\text{mV}$ from steady state.
