

Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

Features

- High speed: 45 ns
- Wide voltage range: 4.5 V to 5.5 V
- Pin compatible with CY62138V
- Ultra low standby power
 - Typical standby current: 1 μ A
 - Maximum standby current: 5 μ A
- Ultra low active power
 - Typical active current: 1.6 mA @ f = 1 MHz
- Easy memory expansion with $\overline{CE}_1$, CE_2 , and $\overline{OE}$ features
- Automatic power down when deselected
- Complementary metal oxide semiconductor (CMOS) for optimum speed and power
- Available in Pb-free 32-pin SOIC and 32-pin thin small outline package (TSOP) II packages

Functional Description

The CY62138F is a high performance CMOS static RAM organized as 256K words by 8 bits. This device features advanced circuit design to provide ultra low active current. This is ideal for providing More Battery Life™ (MoBL®) in portable applications. The device also has an automatic power down feature that significantly reduces power consumption when addresses are not toggling. Placing the device into standby mode reduces power consumption by more than 99% when deselected (CE_1 HIGH or CE_2 LOW).

To write to the device, take Chip Enable ($\overline{CE}_1$ LOW and CE_2 HIGH) and Write Enable ($\overline{WE}$) inputs LOW. Data on the eight I/O pins (I/O_0 through I/O_7) is then written into the location specified on the address pins (A_0 through A_{17}).

To read from the device, take Chip Enable ($\overline{CE}_1$ LOW and CE_2 HIGH) and output enable ($\overline{OE}$) LOW while forcing Write Enable ($\overline{WE}$) HIGH. Under these conditions, the contents of the memory location specified by the address pins appear on the I/O pins.

The eight input and output pins (I/O_0 through I/O_7) are placed in a high impedance state when the device is deselected (CE_1 HIGH or CE_2 LOW), the outputs are disabled ($\overline{OE}$ HIGH), or during a write operation ($\overline{CE}_1$ LOW and CE_2 HIGH and $\overline{WE}$ LOW).

The CY62138F device is suitable for interfacing with processors that have TTL I/P levels. It is not suitable for processors that require CMOS I/P levels. Please see [Electrical Characteristics on page 4](#) for more details and suggested alternatives.

Notes

- $V_{IL(min)}$ = -2.0 V for pulse durations less than 20 ns.
- $V_{IH(max)}$ = $V_{CC} + 0.75$ V for pulse durations less than 20 ns.
- Full device AC operation assumes a 100 μs ramp time from 0 to $V_{CC(min)}$ and 200 μs wait time after V_{CC} stabilization.
- Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at $V_{CC} = V_{CC(typ)}$, $T_A = 25$ °C.
- Please note that the maximum V_{OH} limit does not exceed minimum CMOS V_{IH} of 3.5 V. If you are interfacing this SRAM with 5 V legacy processors that require a minimum V_{IH} of 3.5 V, please refer to Application Note [AN6081](#) for technical details and options you may consider.
- Chip enables (CE_1 and CE_2) must be at CMOS level to meet the I_{SB2} / I_{CCDR} spec. Other inputs can be left floating.

10. Chip enables (CE_1 and CE_2) must be at CMOS level to meet the I_{SB2} / I_{CCDR} spec. Other inputs can be left floating.
11. Full device AC operation requires linear V_{CC} ramp from V_{DR} to $V_{CC(min)} \geq 100 \mu\text{s}$ or stable at $V_{CC(min)} \geq 100 \mu\text{s}$.
12. $\overline{CE}$ is the logical combination of CE_1 and CE_2 . When CE_1 is LOW and CE_2 is HIGH, $\overline{CE}$ is LOW; when CE_1 is HIGH or CE_2 is LOW, $\overline{CE}$ is HIGH.

Notes

13. In an earlier revision of this device, under a specific application condition, READ and WRITE operations were limited to switching of the chip enable signal as described in the Application Note [AN66311](#). However, the issue has been fixed and in production now, and hence, this Application Notes is no longer applicable. It is available for download on our website as it contains information on the date code of the parts, beyond which the fix has been in production.
14. Test conditions for all parameters other than tri-state parameters assume signal transition time of 3 ns (1 V/ns) or less, timing reference levels of $V_{CC(typ)}/2$, input pulse levels of 0 to $V_{CC(typ)}$, and output loading of the specified I_{OL}/I_{OH} as shown in the [Figure 2 on page 5](#).
15. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
16. t_{HZOE} , t_{HZCE} , and t_{HZWE} transitions are measured when the outputs enter a high impedance state.
17. The internal write time of the memory is defined by the overlap of $\overline{WE}$, $\overline{CE}_1 = V_{IL}$, and $\overline{CE}_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.
18. The minimum write cycle pulse width should be equal to the sum of t_{HZWE} and t_{SD} .

Figure 5. Read Cycle No. 2 ($\overline{\text{OE}}$ Controlled) [20, 21, 22]

Notes

19. The device is continuously selected. $\overline{\text{OE}}$, $\overline{\text{CE}}_1 = V_{IL}$, $\text{CE}_2 = V_{IH}$.

20. $\overline{\text{WE}}$ is HIGH for read cycle.

21. Address valid before or similar to $\overline{\text{CE}}_1$ transition LOW and CE_2 transition HIGH.

22. $\overline{\text{CE}}$ is the logical combination of $\overline{\text{CE}}_1$ and CE_2 . When $\overline{\text{CE}}_1$ is LOW and CE_2 is HIGH, $\overline{\text{CE}}$ is LOW; when $\overline{\text{CE}}_1$ is HIGH or CE_2 is LOW, $\overline{\text{CE}}$ is HIGH.

Figure 7. Write Cycle No. 2 ($\overline{\text{CE}}_1$ or $\overline{\text{CE}}_2$ Controlled) [23, 24, 25, 26]

Notes

23. $\overline{\text{CE}}$ is the logical combination of $\overline{\text{CE}}_1$ and $\overline{\text{CE}}_2$. When $\overline{\text{CE}}_1$ is LOW and $\overline{\text{CE}}_2$ is HIGH, $\overline{\text{CE}}$ is LOW; when $\overline{\text{CE}}_1$ is HIGH or $\overline{\text{CE}}_2$ is LOW, $\overline{\text{CE}}$ is HIGH.
24. The internal write time of the memory is defined by the overlap of $\overline{\text{WE}}$, $\overline{\text{CE}}_1 = V_{\text{IL}}$, and $\overline{\text{CE}}_2 = V_{\text{IH}}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.
25. Data I/O is high impedance if $\overline{\text{OE}} = V_{\text{IH}}$.
26. If $\overline{\text{CE}}_1$ goes HIGH or $\overline{\text{CE}}_2$ goes LOW simultaneously with $\overline{\text{WE}}$ HIGH, the output remains in high impedance state.
27. During this period, the I/Os are in output state. Do not apply input signals.

Switching Waveforms (continued)

Figure 8. Write Cycle No. 3 ($\overline{WE}$ Controlled, $\overline{OE}$ LOW) [28, 29, 30]

Notes

28. $\overline{CE}$ is the logical combination of $\overline{CE}_1$ and $\overline{CE}_2$. When $\overline{CE}_1$ is LOW and $\overline{CE}_2$ is HIGH, $\overline{CE}$ is LOW; when $\overline{CE}_1$ is HIGH or $\overline{CE}_2$ is LOW, $\overline{CE}$ is HIGH.

29. If $\overline{CE}_1$ goes HIGH or $\overline{CE}_2$ goes LOW simultaneously with $\overline{WE}$ HIGH, the output remains in high impedance state.

30. The minimum write cycle pulse width should be equal to the sum of t_{HZWE} and t_{SD} .

31. During this period, the I/Os are in output state. Do not apply input signals.
